#### Abstract

**Novelty:** A grid file system for storing the files and offering a service by using the storage of a personal computer and the network resources distributed worldwide is provided to transmit the large capacity of the data regardless of a bandwidth by dispersing the bandwidth requested in the file transfer depending on the number of the personal **\*\*computers\*\*** in a **\*\*grid\*\*** area.

**Detailed Description:** A grid file system server fragments the file of the large capacity and **\*\*replicates\*\*** the fragment files. The replica files are dispersed in the personal **\*\*computers\*\*** participating in the **\*\*grid\*\*** file system service. If the specific data are requested, the file search and inquiry are requested for a central server having the file distribution information of the grid file system via a grid file system agent. The files dispersed in the various places are downloaded

sequentially, and added to each other to obtain a complete file. Herein, the parallel processing is possible and the network environment of a high bandwidth is not needed. Thus, a high-quality file service is realized.

Respectfully submitted,
